3500/64M Dynamic Pressure Monitor

Datasheet

Bently Nevada Machinery Condition Monitoring

Description

The 3500/64M Dynamic Pressure Monitor is a single slot, four-channel monitor that accepts input from high temperature pressure transducers and uses this input to drive alarms. The monitor's one measured variable per channel is bandpass dynamic pressure.

You can use the 3500 Rack Configuration Software to configure the bandpass corner frequencies along with an additional notch filter. The monitor provides a recorder output for control system applications.

The primary purpose of the 3500/64M Dynamic Pressure Monitor is to provide the following:

- Machinery protection by continuously comparing monitored parameters against configured alarm setpoints to drive alarms
- Essential machine information for operations and maintenance personnel

Each channel, depending on configuration, conditions its input signal to generate various parameters called **measured variables**. You can configure **alert** and **danger** setpoints for each active measured variable.

Signal Conditioning

Dynamic Pressure - Direct Filter	
Low mode	5 Hz to 4 KHz If no LP filter is chosen, the range extends to approximately 5.285 KHz
High mode	10 Hz to 14.75 KHz Fixed low pass

Low and high filtering modes are options for a channel pair. Channels 1 and 2 form a pair, and channels 3 and 4 are the other pair. You may select different band pass options on each channel of a channel pair. However, the channels within the pair must operate in the same filtering mode.

You can set up the signal processing so that the monitor feeds only the channel 1 input to all four channels. This feature is called Cascade Mode and is denoted as **1 >ALL** in the 3500 Rack Configuration Software.

In Cascade Mode, you can select filter mode options for a channel pair only. One transducer provides input to four channels for different filtering requirements. As a result, you can configure four separate bandpass filter options and four separate full-scale ranges with one transducer input.

The two modes of filtering provide different qualities of filtering.

Low Mode

Filter Quality	
High pass	10-pole (200dB per decade, 60 dB per octave)
Low pass (LP)	10-pole (200dB per decade, 60 dB per octave)
Fixed low pass LP = none	-78 dB minimum attenuation in the stop band.

High Mode

Filter Quality	
High pass Low pass	6-pole (120 dB per decade, 36 dB per octave) -65 dB minimum attenuation in the stop band
Line rejection (notch) filter	The line rejection filter has two settings, 50 or 60 Hz. Filter response and center frequency selections are valid for both settings.
Filter quality response	-0.175 dB (98%) of Full Scale at Center Frequency of +2 Hz and above -0.175 dB (98%) of Full Scale at Center Frequency of –2 Hz and below -35 dB (1.8%) of Full Scale from –0.5 Hz of Center Frequency to +0.5 Hz of Center Frequency

Alarms

Alarm Setpoints	Use the 3500 Rack Configuration Software to set alert and danger levels for the direct values measured by the monitor. Alarms are adjustable from 0 to 100% of full-scale for each measured value. However, when the full-scale range exceeds the range of the transducer, the range of the transducer will limit the setpoint.
Accuracy of alarm setpoints	Within 0.13% of the desired value

Alarm Time Delays

You can program alarm delays using the 3500 Rack Configuration Software from one to 60 seconds in one second intervals.

Alert	From one to 60 seconds in one second intervals
Danger	0.1 seconds or from one to 60 seconds in 0.1 second intervals
